# DataConduIT: the EventText property of Lnl_SecurityEvent is not loaded

Last Modified on 04/07/2025 5:45 pm EDT

## Symptom

The EventText property of Lnl_SecurityEvent is always empty, but is expected to contain the event's associated text (or event parameter).

## Resolution

In order to retrieve an event's associated text, use the provided SerialNumber property to lookup the corresponding Lnl_LoggedEvent, as follows:

```
SELECT * FROM Lnl_LoggedEvent WHERE SerialNumber = <value of SerialNumber property from received event>
```

The Lnl_LoggedEvent also has an EventText property, and this contains the actual value of the associated text.

## Applies To

OnGuard (All versions)

## Additional Information

It is best to cache the event subtype definitions (Lnl_EventSubtypeDefinition), and check the SupportParameters property to see if an event has a parameter before loading the corresponding Lnl_LoggedEvent.
