

Replication Error: Cannot insert duplicate key row object 'dbo.reader' with unique index 'readdescid'

Last Modified on 01/05/2022 12:43 pm EST

Symptom

Enterprise transactions are failing. When running Replicator manually, the following error is observed while replicating:

```
"Exception occurred while replicating hardware transaction for table [Reader].
Unexpected application error! Internal Error Code [509000012]:
Cannot insert duplicate key row object 'dbo.reader' with unique index 'readdescid'. The duplicate key
value is 9(3606, "Reader's Name")
The statement has been terminated."
```

Resolution

In the Region that is producing this error when running Replicator as an application, complete the following steps:

1. Locate the reader described in the error message in System Administration. The reader you are looking for is provided where it says "Reader's Name" in the error message.
2. Change the the name of that reader by adding one (1) character to it.
3. Run Replicator and verify that the error message does not re-occur.
4. Replicator should run normally after that point.
